# Why and How to do Strength Design of Masonry Structures

Strength design was added to the TMS 402 Building Code for Masonry Structures in 2002. However, most masonry is still designed by the Allowable Stress Design method. Strength design generally results in more efficient designs than with Allowable Stress Design. This talk will review the design assumptions for strength design, and look at the design of beams, bearing walls, and shear walls using strength design. Practical design methods and tips will be provided for each member type, and examples will illustrate the design process. The results of each design will be compared to allowable stress design. This seminar will provide the engineer with the tools necessary to begin using strength design for masonry, and realizing the benefits it can offer.

## Speaker Bio:

Richard Bennett, PhD, PE. is a Professor of Civil and Environmental Engineering at the University of Tennessee. He is a member of the Board of Directors of The Masonry Society and a Fellow of The Masonry Society. Dr. Bennett has been very active on the TMS 402/602 Code Committee. He has chaired the Flexural, Axial Loads, and Shear subcommittee and served as the vice-chair of the 2013 MSJC Committee. Dr. Bennett was the chair of the main committee that is developed the 2016 code, and is currently 2nd vice-chair of the TMS 402/602 Code Committee. He is also a member of ASTM C12 on mortars and grouts and ASTM C15 on manufactured masonry units.
